## Description

This widget 360 provides a 3D view of a host dependency tree.

This widget can be very usefull for complex dependency tree:

- A complex dependency tree is difficult to see in the Dependency Graph Widget.
- The Widget 360 provides a clear overview of the tree.

Each tree node contains the following information of the host:

- Its name
- Its status
- An icon of the host's type. The icon is based on tags detected during the configuration phase.

? Unknown Attachment

*(example: an Apache host will have the feather icon)*

? Unknown Attachment

From the chosen host, it displays the 3D dependency tree up to 10 jumps (dependency links between elements defined in the [Configuration UI](#))

### NOTE

The 360 widget displays only hosts.

But if a check on the host has a Critical or a Warning state, the host will also be displayed in the same state.

## Usage

### Center an element in the view:

- Double click on an element, a blue wired box will surround, indicating it's now selected.
- The view will pan and update zoom level accordingly.

### Orbit around the selected element:

- While keeping left mouse button pressed, move the mouse to orbit around the selected element.
- to change the orbiting center, center the view on an other element.

### Pan View:

While keeping the right mouse button pressed, move mouse to pan view.

## Configuration

? Unknown Attachment

1. Select a host or cluster name in the first list.
  - The total number of hosts and clusters will be displayed near "Select Host/Cluster" **(1)**.
  - If no host selected yet, the list of available hosts will automatically opened.
  - You can search (filter) for a host name, typing into the input on top of the list.
  - You can clean the current selection by clicking on the swipe icon **(2)**.
2. When configured, press the SUBMIT button **(3)**.
